(4) WINDOW MOVEMENT SYSTEM

(7)Abstract:

PURPOSE: To move a window to a desired position instantaneously by raising a window on a touch input enabled area pattern and redisplaying a window at the specific position, and resetting a window movement request for prescribed time later.

CONSTITUTION: When a touch signal generated on the touch panel input area 12 for a display screen 11 is received, it is judged as the window movement request and while the window 13 is displayed, the touch input enabled area pattern 18 which is stored previously is displayed over the entire display screen 11. Then when a certain window movement position is specified on the touch input enabled area pattern 18, the current window is raised and a window is redisplayed at the specified position. The window movement request is reset and the last state is entered unless the movement position of the window 13 is specified for the prescribed time after the window movement request. Consequently, the window being displayed can be moved to a desired position instantaneously.

LEGAL STATUS

[Date of request for examination]

[Date of sending the examiner's decision of rejection]

[Kind of final disposal of application other than the examiner's decision of rejection or application converted to registration]

[Date of final disposal for application]

[Patent number]

[Date of registration]

[Number of appeal against examiner's decision of rejection]

[Date of requesting appeal against examiner's decision of rejection]

[Date of extinction of right]
